

# Package ‘shinyr’

November 6, 2019

**Type** Package

**Title** Easy insights through your data

**Version** 0.2

**Description**

'shinyr' is developed to build dynamic shiny based dashboards to analyze the data of your choice. It provides simple yet genius dashboard design to subset the data, perform exploratory analysis and predictive analysis by means of interactive filter mechanism.

**Depends** R (>= 3.1.0),

**Imports** dplyr, shiny, shinydashboard, tm, wordcloud, corrplot, randomForest, RColorBrewer, DMwR, caret, nnet, plotly

**Maintainer** The package maintainer <itsjay510@gmail.com>

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 6.1.1

**Suggests** testthat

**URL** <https://github.com/rpushker/shinyr>

**NeedsCompilation** no

**Author** Jayachandra N [aut, cre],  
Pushker Ravindra [aut]

## R topics documented:

confmatrix . . . . .	2
dataPartition . . . . .	3
detectClass . . . . .	3
excludeThese . . . . .	4
getcharacterCols . . . . .	5
getCoefficients . . . . .	5
getDataInsight . . . . .	6
getFeqTable . . . . .	7

getMostRepeatedValue . . . . .	7
getnumericCols . . . . .	8
getWordCloud . . . . .	9
groupByandSumarize . . . . .	9
imputeMyData . . . . .	10
make_var . . . . .	11
missing_count . . . . .	11
multinomial . . . . .	12
plotCor . . . . .	13
randomForestModel . . . . .	13
regressionModelMetrics . . . . .	14
shineMe . . . . .	15
splitAndGet . . . . .	15
valid_sets . . . . .	16

<b>Index</b>	<b>17</b>
--------------	-----------

---

confmatrix	<i>confmatrix</i>
------------	-------------------

---

**Description**

confmatrix

**Usage**

confmatrix(actuals, preds)

**Arguments**

actuals	factor
preds	factor

**Value**

table

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:  
confmatrix(c(1,1,1,0), c(1,1,0,0))  
  
## End(Not run)
```

---

dataPartition	<i>dataPartition</i>
---------------	----------------------

---

**Description**

dataPartition

**Usage**

```
dataPartition(df, train_data_perc)
```

**Arguments**

df	data.frame which need to be devided into train and test subset
train_data_perc	numeric value between 1 to 100

**Value**

list of length 2 which contains Train data and Test data

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:  
dataPartition(iris, 80)  
  
## End(Not run)
```

---

detectClass	<i>detectClass</i>
-------------	--------------------

---

**Description**

detectClass

**Usage**

```
detectClass(x)
```

**Arguments**

x	a vector
---	----------

**Value**

type of the vector

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:
detectClass(c(1,2,3))
detectClass(c("a","b"))
detectClass(iris$Species)

## End(Not run)
```

---

excludeThese	<i>excludeThese</i>
--------------	---------------------

---

**Description**

excludeThese

**Usage**

```
excludeThese(set, items_to_exclude)
```

**Arguments**

set	vector
items_to_exclude	vector to exclude from the whole set

**Value**

vector

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:
excludeThese(1:10, 1)

## End(Not run)
```

---

getcharacterCols	<i>getcharacterCols</i>
------------------	-------------------------

---

**Description**

getcharacterCols

**Usage**

```
getcharacterCols(dat)
```

**Arguments**

dat	data frame
-----	------------

**Value**

A Character vector of names of numeric columns of a given data frame

**Author(s)**

Jayachandra N

---

getCoefficients	<i>getCoefficients</i>
-----------------	------------------------

---

**Description**

getCoefficients

**Usage**

```
getCoefficients(model)
```

**Arguments**

model	lm model
-------	----------

**Value**

data.frame of coefficients

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:  
x <- lm(Sepal.Length ~ ., iris)  
getCoefficients(x)  
  
## End(Not run)
```

---

getDataInsight	<i>getDataInsight</i>
----------------	-----------------------

---

**Description**

getDataInsight

**Usage**

```
getDataInsight(temp)
```

**Arguments**

temp	data frame
------	------------

**Value**

list of details of data

**Author(s)**

Jayachandra N

**Examples**

```
getDataInsight(mtcars)  
getDataInsight(iris)
```

---

`getFeqTable`*getFeqTable*

---

**Description**`getFeqTable`**Usage**`getFeqTable(text)`**Arguments**

<code>text</code>	plain text or a paragraph
-------------------	---------------------------

**Value**

data frame of word and it's frequency.

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:  
getFeqTable("India is Incredible!")  
  
## End(Not run)
```

---

`getMostRepeatedValue`*getMostRepeatedValue*

---

**Description**`getMostRepeatedValue`**Usage**`getMostRepeatedValue(vec)`**Arguments**

<code>vec</code>	Vector to calculate most repeated values
------------------	--

**Value**

most repeated values in the given set of values

**Examples**

```
## Not run:
getMostRepeatedValue(c(1,2,3,3,3,2))
getMostRepeatedValue(c("R", "R", "Python", "Python", "R"))

## End(Not run)
```

---

getnumericCols

*getnumericCols*

---

**Description**

getnumericCols

**Usage**

```
getnumericCols(dat)
```

**Arguments**

dat                      data frame

**Value**

Character vector of names of numeric columns of given data frame

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:
getnumericCols(iris)
getnumericCols(mtcars)

## End(Not run)
```

---

getWordCloud	<i>getWordCloud</i>
--------------	---------------------

---

**Description**

getWordCloud

**Usage**

```
getWordCloud(d)
```

**Arguments**

d	table of word's frequency
---	---------------------------

**Value**

Word cloud plot

**Examples**

```
## Not run:  
x <- getFeqTable("Hello! R is Great")  
getWordCloud(x)  
  
## End(Not run)
```

---

groupByandSumarize	<i>groupByandSumarize</i>
--------------------	---------------------------

---

**Description**

groupByandSumarize

**Usage**

```
groupByandSumarize(df, grp_col, summarise_col, FUN = mean)
```

**Arguments**

df	data frame
grp_col	column name to group
summarise_col	column name to summarize
FUN	function to summarize

**Value**

summarized table

**Examples**

```
## Not run:
groupByandSumarize(mtcars, grp_col = c("am"), summarise_col = "hp", FUN = "mean")

## End(Not run)
```

---

imputeMyData	<i>imputeMyData</i>
--------------	---------------------

---

**Description**

imputeMyData

**Usage**

```
imputeMyData(df, col, FUN)
```

**Arguments**

- df                    data frame to impute
- col                   a column name of data frame to impute
- FUN                   a function to be used for imputing values one of(mean, median, sum, min, max)

**Value**

data frame after imputing the values

**Examples**

```
## Not run:
x <- head(iris)
x$Sepal.Length[1] <- NA
imputeMyData(x, "Sepal.Length", "mean")

## End(Not run)
```

---

make_var	<i>make_var</i>
----------	-----------------

---

**Description**

make\_var

**Usage**

make\_var(prefix, var, suffix)

**Arguments**

prefix	prefix character
var	character to convert
suffix	suffix character

**Value**

variable

**Examples**

```
## Not run:  
make_var("", "Jay", "")  
make_var("", "Incredible_India", "")  
  
## End(Not run)
```

---

missing_count	<i>missing_count</i>
---------------	----------------------

---

**Description**

missing\_count

**Usage**

missing\_count(x)

**Arguments**

x	vector
---	--------

**Value**

Number of missing values in the given set of values

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:  
missing_count(c(1,2,3))  
missing_count(c(NA, 1, NA, "NULL", ""))  
  
## End(Not run)
```

---

multinomial

*multinomial*

---

**Description**

multinomial

**Usage**

```
multinomial(eqn, df)
```

**Arguments**

eqn	formula to build model
df	data frame

**Value**

model

**Examples**

```
## Not run:  
multinomial( Species ~ ., iris)  
  
## End(Not run)
```

---

plotCor	<i>plotCor</i>
---------	----------------

---

**Description**

plotCor

**Usage**

plotCor(cor\_dat, my\_method)

**Arguments**

cor_dat	Corelation matrix
my_method	method to plot Example: circle

**Value**

Corelation plot

---

randomForestModel	<i>randoMForestModel</i>
-------------------	--------------------------

---

**Description**

randoMForestModel

**Usage**

randomForestModel(eqn, df)

**Arguments**

eqn	formula
df	data.frame

**Value**

rf model

**Examples**

```
## Not run:  
#' mod <- randomForestModel( Species ~ ., iris)  
  
## End(Not run)
```

```
regressionModelMetrics  
      regressionModelMetrics
```

---

**Description**

regressionModelMetrics

**Usage**

```
regressionModelMetrics(actuals, predictions, model)
```

**Arguments**

actuals	numeric vector of actual values
predictions	numeric vector of predictions
model	lm model object

**Value**

list

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:  
mod <- lm(formula = wt ~ ., data = mtcars)  
predictions <- predict(mod, mtcars[,-6])  
actuals <- mtcars[,6]  
regressionModelMetrics(actuals = actuals,  
  predictions = predictions, model = mod)  
  
## End(Not run)
```

---

`shineMe`*shineMe*

---

**Description**`shineMe`**Usage**`shineMe()`**Value**`shiny ui page`**Author(s)**`Jayachandra N`**Examples**

```
## Not run:  
shineMe()  
  
## End(Not run)
```

---

`splitAndGet`*splitAndGet*

---

**Description**`splitAndGet`**Usage**`splitAndGet(x)`**Arguments**

<code>x</code>	string to split into words
----------------	----------------------------

**Value**`List of worrds`

**Author(s)**

Jayachandra N

**Examples**

```
## Not run:  
splitAndGet("R programming is awesome!")  
  
## End(Not run)
```

---

valid\_sets

*valid\_sets*

---

**Description**

valid\_sets

**Usage**

```
valid_sets(package = NULL, cols = NULL)
```

**Arguments**

package	package name to fetch inbuilt data sets example: "datasets"
cols	numeric to specify condition on how many columns should data frame have

**Value**

data frame all available datasets of class data frame

**Author(s)**

Ravindra Pushker  
Jayachandra N

**Examples**

```
## Not run:  
valid_sets()  
  
## End(Not run)
```
